

# Uber CASE STUDY

## SUBMISSION

# Abstract

## Business Objective:

- identify the root cause of the problem (i.e. cancellation and non-availability of cars)
- recommend ways to improve revenue by reducing on cancellation and non-availability

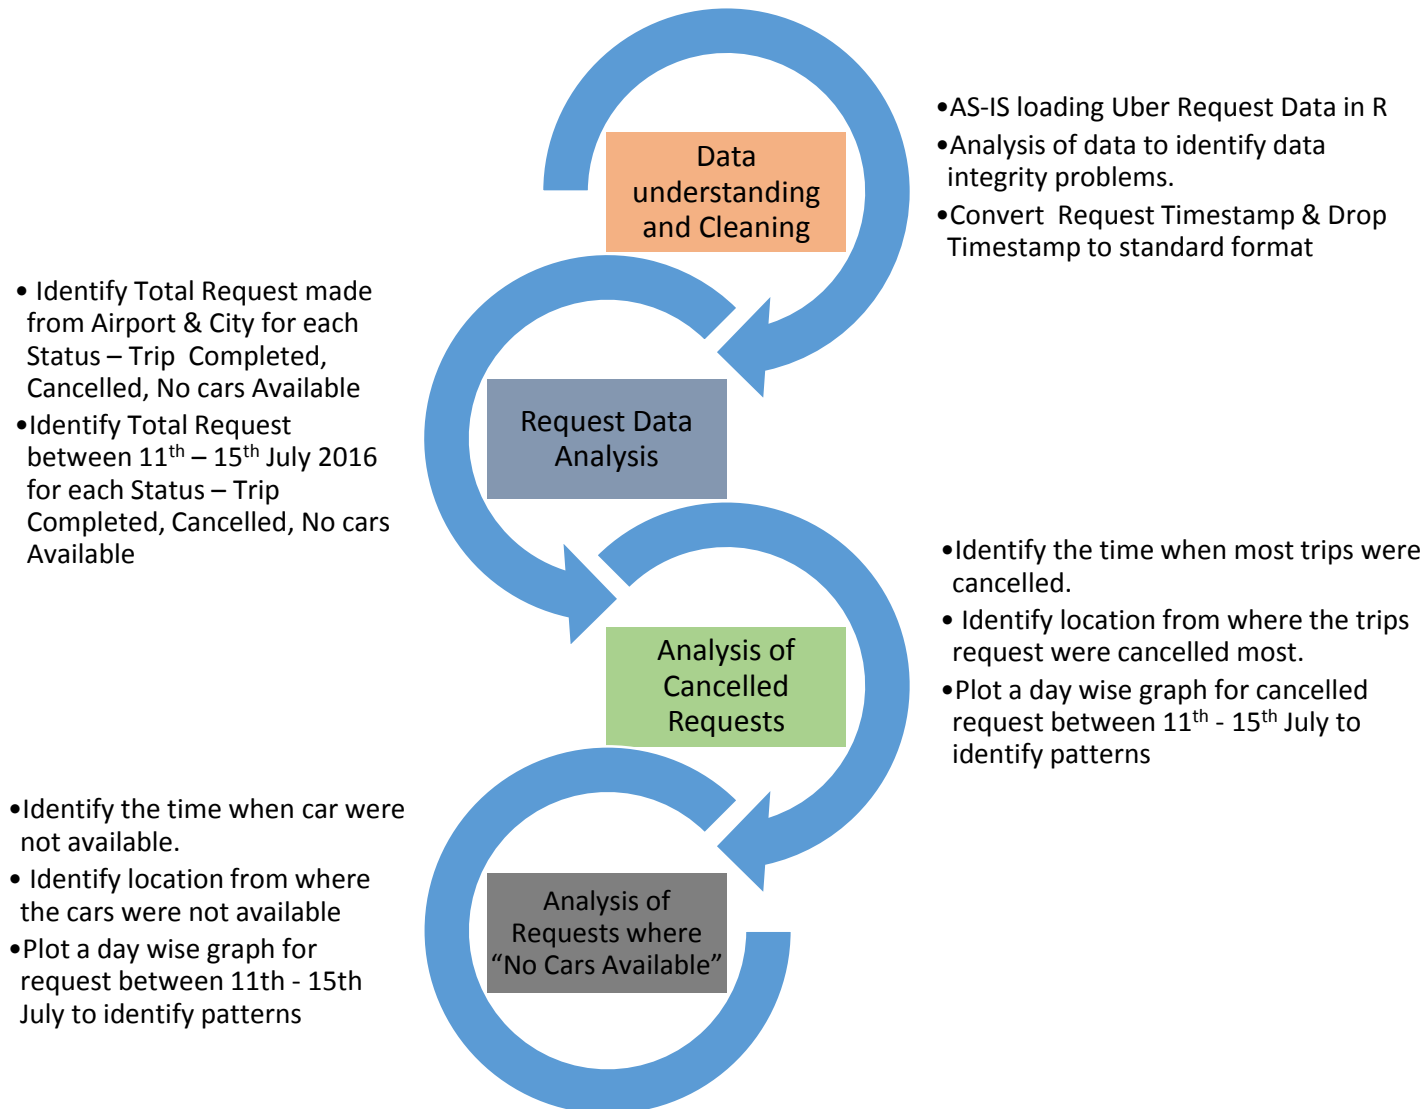

**Strategy:** Plot charts to visually identify problems areas

## Constraints:

- only trips to and from airport are being considered.

## Data Source:

- masked data set of Trip requested between 11<sup>th</sup> July to 15<sup>th</sup> July 2016
- 6700+ requests with various parameters

All Requests

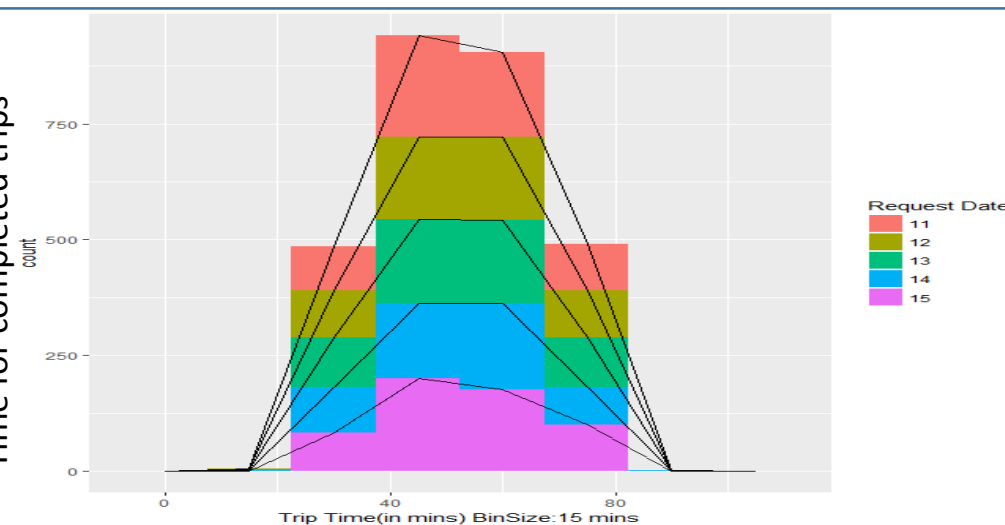

Total # of Requests by Date

All Requests by Pickup Point

Histogram - Day wise Trip Time for completed trips

## Analysis – Total Requests based on date and pickup(Contd...)

### All Request

- Trip Completed - Only **42%** of total Request
- **58%** Requests were either **“Cancelled”** or not fulfilled due to **“No Cars Available”**
- More # of requests during early mornings(from city) and Late evenings (from Airport).

### Status - No Cars Available

- 40% Request not handled
- More than 500 Requests/day could not be completed

### Status - Cancelled

- 19% Request not handled due to this reason
- More than 200 Requests/day were cancelled by drivers

### Pickup Point

- No. of requests from city were higher during early mornings.
- No. of requests from Airport were higher during late evening and night time
- High number of Requests from Airport were not fulfilled due to **“No Cars Available”**
- Relatively high number of requests from City were cancelled by drivers

## “Cancelled” Request

Requests by Time

## “No Car Available” Request

Requests by Time

## “Cancelled” Request

Requests by Time and Pickup point

## “No Car Available” Request

Requests by Time

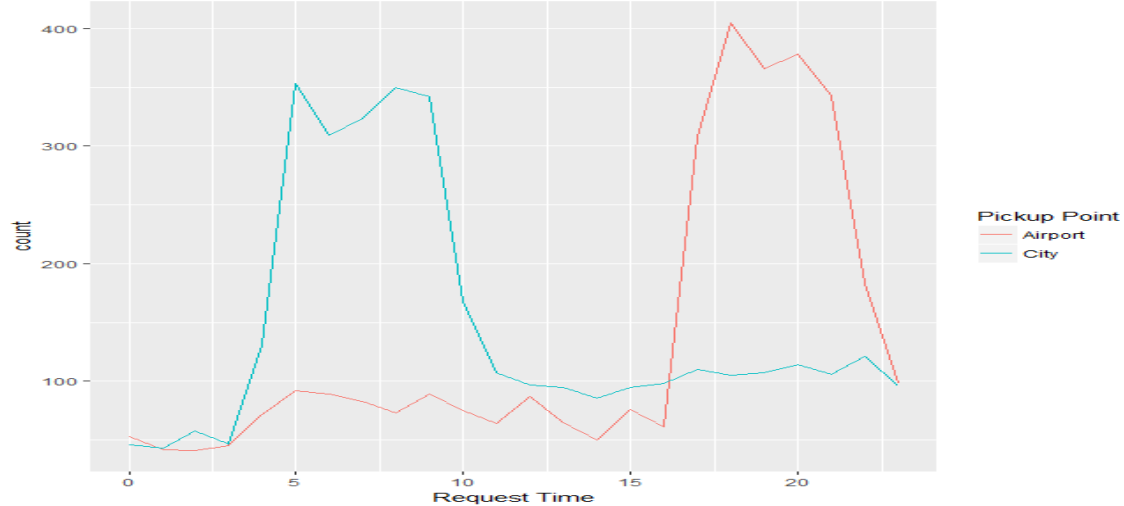

## Pickup

Request count by time (All Requests)

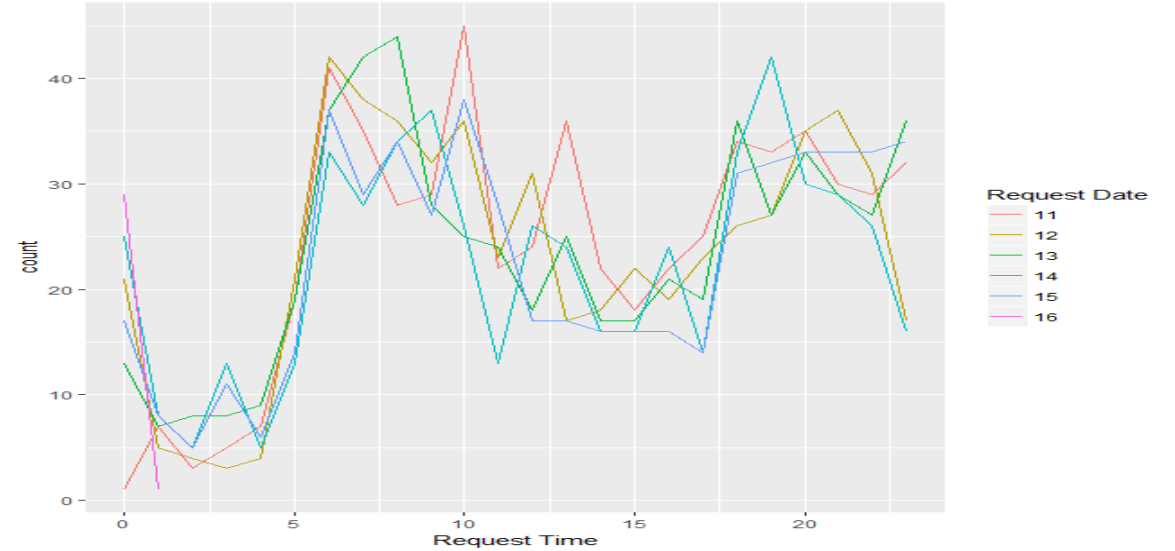

Request count by Pickup Point (All Requests)

## Drops

Request count by time (All Requests)

Drop count by Pickup Point (All Requests)

## Overall Analysis

- ❖ During peak hours from both pickup locations (city, airport), there are not enough taxis available:
  - ❑ City (4AM-10AM):
    - ❑ 75-90 Requests for pickup on a daily basis
    - ❑ 30-40 Cabs are available after drops are complete during the same time
  - ❑ Airport (5PM-11PM):
    - ❑ 80-100 Requests for pickup on daily basis
    - ❑ 30-40 Cabs available
- ❖ During early mornings (4AM-10AM), number of request are more from city. Airport has fewer pickup request during the same time window
- ❖ During evening and night (5PM-11PM), pickup requests are more from Airport. City has fewer requests during the same time period.
- ❖ Most Cancellations happen during early morning (4AM-10AM) from City
- ❖ Most request with status as “No Cars Available” are for Airport pickup requests raised during evening and night (5PM-11PM).
- ❖ Above two may be because of the wait time the driver has to spend at Airport during early morning or in City during evening/night time
- ❖ Pattern is consistent for the entire duration of data (11<sup>th</sup> July – 15<sup>th</sup> July)

## Recommendations

- ❖ Give incentives to drivers who do not cancel Pickup Requests consistently in a given duration.
- ❖ Penalize drivers who cancel requests too often
- ❖ Enable drivers with short trips(<30 mins) to return quickly at peak time locations by letting them know no. of un-fulfilled requests to help them take a call on whether they want to wait or go to peak location to pickup travelers.
- ❖ Share peak loads information with drivers so that they know where most requests are coming from.
